Meeting Date: May 31, 2024

## From: MOA Elections Team

Subject: Risk Limiting Audit for the May 14, 2024 Mayoral Runoff Election

## I. Executive Summary

The MOA Elections Team conducted a post-election audit that contained three areas of focus.

1. Hand-Count. A pre-determined percentage of ballots in randomly specified contests was selected and the actual random ballots for those specified races were hand counted.
2. Machine Review. Cast Vote Records were produced from the tabulation system and tallied for the ballots selected.
3. Comparison of Hand-Count and Machine Review. The totals from the hand-count, detailed in paragraph 1, and the totals from the machine count, detailed in paragraph 2, were compared.

The results of the MOA post-election Risk Limiting Audit are that the scanning, adjudication, and tabulation system performed as expected and the results reflect the will of the voters. All ballots were adjudicated and tabulated as expected. The results of the hand-count and the machine tabulation were identical. ${ }^{1}$

## II. WHAT IS A POST-ELECTION RISK LIMITING AUDIT?

A. Research. Research defines a post-election audit as a check to confirm that the voting equipment and procedures used to count votes worked properly. Post-election audits are recommended by election security experts as one method of protecting the integrity of elections.

There are many types of "post-election audits" used to validate election results or outcomes. As a term of art, it refers to checking paper ballots (or records) against the results produced by the vote tallying equipment to ensure accuracy.

Risk limiting audits (RLA) use statistically developed audit techniques that allows election of a number of ballots to be audited that provide statistical confidence that the tabulation system performed as expected. A RLA is an incremental audit system: If the percentage of risk selected in advance of the audit failed to demonstrate the tabulation system was performing as expected, election officials would review further ballots or conduct a full manual tally of the election.

The MOA Elections Team conducts "Batch-Level Comparison Audits," which is a type of RLA that most resembles a "traditional" audit. In a batch-level comparison audit, the voting system must export identifiable physical batches of ballots. In the MOA RLA, Election Officials physically

[^0]selected random batches from the entire election to audit. In "Batch-Level Comparison Audits" and in the MOA RLA, Election Officials add up the selected batch-level results by hand to verify that they produce the reported contest outcomes. The votes in each selected batch were examined manually and hand-counted, and the audit counts were compared to the tabulation system's report and subtotals. Depending on the number and type of discrepancies the audit finds in the sample, the audit either stops or examines more batches manually.

## B. Implementation of the Risk Limiting Audit at the MOA

Successful implementation of any new election process requires careful thought and a considerable amount of planning. The MOA Elections Team began looking at post-election audits in 2020. One important step in preparing for the post-election audit, was obtaining the imprinters on the ballot scanners in 2020; the imprinters put a unique number - the scanner, batch, and ballot number - on each ballot, allowing elections officials the ability to pull the actual ballot to confirm the votes.

The MOA Elections Team conducted a practice audit after the 2021 Regular Municipal election in preparation for implementation of post-election audit in 2022. The practice was worthwhile: The Elections Team determined it tested too many ballots in one race and too few in another; the Elections Team pulled individual ballots which was incredibly time consuming. To address this shortcoming, the 2022 audits tested "batches" of ballots, which was more efficient to select and re-file rather than randomly selecting individual ballots and having to refile those.

Now, the Elections Team is happy to provide the results of the Risk Limiting Audit at certification.

## III. PROCEDURES FOR THE RISK LIMITING AUDIT

## A. Selection of Races and Measure to be audited.

1. Selection of Race and Measure. The MOA Risk Limiting Audit Procedures require the MOA Elections Team to identify the races and measures to be audited by rolling a 6 -sided die. In a Mayoral election year, the team will automatically audit the top two mayoral candidates and roll the 6 -sided die to randomly select the ballot proposition to audit. In years without a Mayoral race, the team uses the die to randomly select one Assembly race and one ballot proposition to audit.
2. Target Number of Ballots. The Elections Team calculates the target number of ballots per race or measure. For the audit, the team selected $5 \%$ of the ballots cast in the Mayoral Runoff, totaling 4,000 ballots.

The exact calculations for the target number of ballots are as follows:

- Calculate $5 \%$ of ballots cast, regardless of the number of votes cast or spread, rounding up to nearest 1,000 . E.g., change 79,658 to 80,000 for ease of count:

In the 2024 Mayoral Runoff, total ballots cast $=80,000 \times .05=4,000$

For the 2024 Mayoral Runoff, the audit actually reviewed 4,372 ballots.
3. Random Selection of Batches. To reach the 4,000 ballots targeted for review in 2024 Mayoral Runoff, the MOA Elections Team estimated that auditing a minimum of 40 batches would be required, assuming approximately 100 ballots were scanned per batch. However, the Team selected 50 batches for this audit - in the event that some of the batches contained less than the 100 ballots typically scanned per batch.

Next, the team members calculated the percentage of total ballots processed on each scanner: ICC 1 (scanner 1), ICC 2 (scanner 2), and ICC 3 (scanner 3). The result indicated that 29 batches from ICC 1, 11 batches from ICC 2, and 10 batches from ICC 3 would be pulled for audit.

The exact calculations for the number of batches selected from each scanner are as follows:

1. Determine the total number of batches scanned by each ICC:

- ICC $1=542$ batches
- ICC $2=209$ batches
- ICC $3=183$ batches
- 934 total batches to possibly be verified.

2. Determine the percentage of total batches each ICC scanned:

- $\underline{I C C} 1=542 / 934=58 \%$
- ICC $2=209 / 934=22 \%$
- $\underline{I C C} 3=183 / 934=20 \%$

3. For each ICC selected, use the percentage of total batches each ICC scanned to determine the random number of batches needed from each ICC, and then to determine which batch numbers for each ICC to pull. Since 50 batches were selected for verification, the total number of batches for verification from each ICC is as follows:

- $\underline{\text { ICC } 1=58 \% \text { of total batches } \times 50 \text { batches for verification }=29}$
- ICC $2=22 \%$ of total batches x 50 batches for verification $=11$
- $\underline{\text { ICC } 3=20 \% \text { of total batches } \times 50 \text { batches for verification }=10}$

## B. Use Pseudo-Random Number Generator for Random Selection of Batches.

The staff then used the Pseudo-Random Number generator at https://www.stat.berkeley.edu/~stark/Java/Html/sha256Rand.htm to randomly select the batches of ballots from each ICC. Following the instructions on the Pseudo-Random Number Generator, the selected were as follows:
(1) Roll the ten, ten-sided dice one time, and then a second time and input all twenty numbers into the "Seed". "Seed," is the starting point of a random number generator.

(2) Enter the "Seed" and other information into the random number generator and press "Draw Sample." The result is the list of randomly selected items. This process was done for ICC 1, ICC 2, ICC 3 to audit all three scanners.

ICC 1:
Pseudo-Random Sample Using SHA-256
Seed: $2,0,8,2,3,9,5,4,8,7,0,4,0,3,6,2,2,1,3,9$
Number of objects from which to sample: 542
Current sample number: $29 \quad$ Draw this many objects: 29

| reset |

| Randomly selected item: 135 Items selected: <br> $146,19,80,108,51,36,117,105,129,135$ |  |

The batches were pulled and delivered to counting teams.

## C. Hand-Count Results

Mayoral Race - Ballots are sorted by Candidate A, Candidate B, and other ${ }^{2}$. The results of the hand-count are as follows:

| Category | Hand-Count |
| :--- | ---: |
| Candidate 1 | 2361 |
| Candidate 2 | 2011 |
| Total | $\mathbf{4 3 7 2}$ |

## D. Machine Count Verification

After the batches of ballots were hand-counted, the Cast Vote Records for the selected batches of ballots were produced and tallied. The batch totals were transferred to the RLA Worksheet ${ }^{3}$ and are as follows:

## Mayoral Race -

| Category | Machine-Count <br> Total |  |
| :--- | ---: | :---: |
| Candidate 1 | 2361 |  |
| Candidate 2 | 2011 |  |
| Total | $\mathbf{4 3 7 2}$ |  |

## Comparison of the Hand-Count to the Machine Count

[^1]The third and final step in the post-election audit involved comparing the hand-count to the machine count. Here is the comparison:

Mayoral Race -

| Category | Hand- <br> Count | Machine- <br> Count Total |
| :--- | ---: | ---: |
| Candidate 1 | 2361 | 2361 |
| Candidate 2 | 2011 | 2011 |
| Total | $\mathbf{4 3 7 2}$ | $\mathbf{4 3 7 2}$ |

The result of the post-election audit is that of 4,372 randomly selected ballots, the hand count and machine count of those ballots was identical. The conclusion is that the scanning, adjudication, and tabulation system performed as expected and the results of the election demonstrated the will of the voters.

Respectfully Submitted:
MOA Elections Team
William Northrop, Election Administrator
Jamie Heinz, Municipal Clerk
